

# Audit sampling report

This report was created by R version 3.6.3 (2020-02-29) and its package `jfa` (version 0.5.0)<sup>1</sup>.  
`jfa` provides Bayesian and classical audit sampling analyses and is available on CRAN.

`jfa` is free software and you can redistribute it and or modify it under the terms of the GNU GPL-3 as published by the Free Software Foundation. The package is distributed in the hope that it will be useful, but without any warranty; without even the implied warranty of merchantability of fitness for a particular purpose.

Visit the package website (<https://koenderks.github.io/jfa>) to learn more!

## Summary

The objective of this sampling procedure is to determine with a confidence of 95% whether the percentage of misstatement in the population is lower than the performance materiality of 17.425%

Table 1: Summary of the sampling results.

Sample size	Deviations	Total taint
130	6	NaN

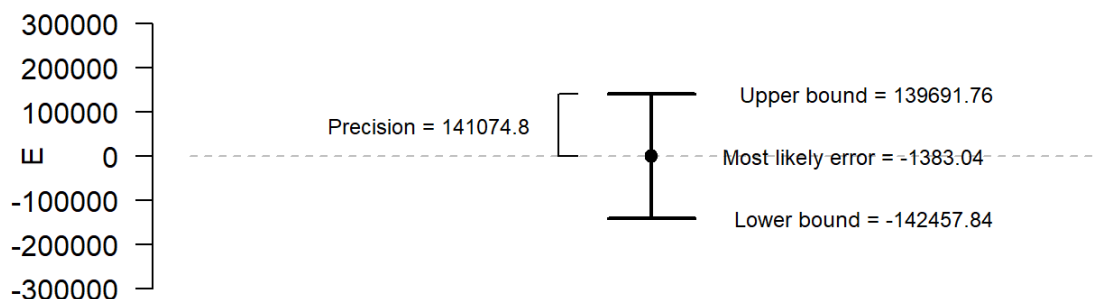

### Outcome: Current sample meets these requirements

The table below summarizes the estimated misstatement in the population, including the most likely error, the 95% upper bound, and the obtained precision. As a justification of these results, appendix A contains the formulas and calculations upon which they are based. Appendix B lists the input data.

Table 2: Summary of the inferential results.

Most likely error	Lower bound	Upper bound	Precision
0.00	-0.01	0.01	0.01 x 100 = %
-1,383.04	-142,457.84	139,691.76	141,074.80 \$

### 95% Confidence interval

## Appendix A: Formulas and calculations

---

These results have been calculated using the difference estimator (Touw & Hoogduin, 2011). The units of inference are individual transactions.

### Notation:

Ist position: $ist = ist\_euro$	Estimated population misstatement: $\hat{E}$
Soll position: $soll = soll\_euro$	Lower bound population misstatement: $E_{lb}$
Sample size: $n = 130$	Upper bound population misstatement: $E_{ub}$
Population size: $N = 50152$	Estimated unit misstatement: $\hat{\theta}$
Population value: $B = 11477820$	
Sampling risk: $\alpha = 0.05$	

### Formulas:

$$\begin{aligned}\hat{E} &= N \times \hat{\theta} \\ &= 50152 \times -0.028 = -1383.038\end{aligned}$$

$$\begin{aligned}[E_{lb}; E_{ub}] &= N \times \left( \hat{\theta} \pm t_{1-\frac{\alpha}{2}} \times \frac{s_e}{\sqrt{n}} \right) \\ &= 50152 \times (-0.028 \pm 2.813) = [-142457.836; 139691.76]\end{aligned}$$

$$\begin{aligned}\hat{\theta} = \bar{e} &= \frac{\sum_{i=1}^n ist_i - soll_i}{n} = \frac{-3.585}{130} = -0.028 \\ t_{1-\frac{\alpha}{2}} &= t_{0.975} = 1.979 \\ s_e &= \sqrt{\frac{\sum_{i=1}^n ([ist_i - soll_i] - \bar{e})^2}{n-1}} = \sqrt{\frac{33897.88}{129}} = 16.21 \\ t_{0.975} \times \frac{s_e}{\sqrt{n}} &= 1.979 \times \frac{16.21}{\sqrt{130}} = 2.813\end{aligned}$$

### Evaluation:

✓ Upper bound lower than performance materiality  $\rightarrow E_{ub} < E_{max} \rightarrow 139691.8 < 2000000$
